**Name:**

Khan Muhamamd Bilal

**Roll-No:**

2024-CET-20

**Department:**

Software Engineering

**Group:**

Computer Engineering Technology

**Semester:**

4th Semester

**Subject:**

Web Designing and Development

**Lab Task:**

Understand basic concepts of Internet and World wide web.

**Submitted To:**

Engr. Sidra Rafique

# Lab Task 1

# Experiment No.1

## Tasks

### 1.What does DNS do?

DNS (Domain Name System) acts as the internet's phone book. It translates human readable domain names (like www.google.com) into IP addresses (like 142.250.64.100) that computers use to identify each other on the network. Without DNS, users would have to memorize numeric IP addresses to visit websites.

### 2. List three top level domain names?

- ***.com*** → Commercial websites
- ***.org*** → Organizations (non-profits, etc.)
- ***.edu*** → Educational institutions

### 3. What is ISP connection?

An **ISP (Internet Service Provider)** connection is the service that connects a user's device to the internet. ISP are companies (like PTCL, Jazz, Zong, Scom) that provide internet access via broadband, fiber, DSL, or mobile data. They assign IP addresses and route data between the user and the rest of the internet.

## 4. Difference between Markup language and Programming language?

| Feature | Markup Language | Programming Language |
|---|---|---|
| **Purpose** | Structures and presents content | Gives logic and instructions to a computer |
| **Logic** | No logic (no loops, conditions) | Has logic (loops, conditions, functions) |
| **Execution** | Interpreted by browsers | Compiled or interpreted by machines |
| **Examples** | HTML, XML | C++, Python, Java |

## 5. Difference between web browser and servers?

| Feature | Web Browser | Web Server |
|---|---|---|
| **Definition** | Software to access websites | Software/hardware that hosts websites |
| **Role** | Sends requests for web pages | Responds by delivering web pages |
| **Location** | Runs on user's device | Runs on a remote machine |
| **Examples** | Chrome, Firefox, Edge | Apache, Nginx, IIS |

## 6. How does a URL enable a user to find information?

A **URL (Uniform Resource Locator)** is a complete web address that pinpoints the exact location of a resource on the internet.

It works in parts:

- ***https://*** → Protocol (how to connect)
- ***www.example.com*** → Domain name (which server)
- ***/page/topic*** → Path (specific file or page)

The browser uses the URL to query DNS, locate the server, and retrieve the exact resource the user wants.

## 7. Write Importance of search engine?

- **Easy Information Retrieval** → Finds relevant information from billions of web pages instantly.
- **Saves Time** → Users get results in seconds without manually browsing sites.
- **Organized Results** → Ranks pages by relevance and quality.
- **Access to Multimedia** → Searches images, videos, news, and documents.
- **Business Visibility** → Helps businesses reach users through search results.
- **Knowledge Sharing** → Connects users to educational and research content worldwide.

## 8. Difference between HTTP and HTML?

| Feature | HTTP | HTML |
|---|---|---|
| **Full Form** | Hypertext Transfer Protocol | Hypertext Markup Language |
| **Type** | Communication protocol | Markup language |
| **Purpose** | Transfers data between browser and server | Structures and displays web content |
| **Role** | The delivery system | The content/package being delivered |

**HTTP** → ***How the webpage travels.***

**HTML** → ***What the webpage is made of.***

## 9. Define VBScript?

**VBScript (Visual Basic Scripting Edition)** is a lightweight scripting language developed by Microsoft, based on Visual Basic. It was used to add interactivity and logic to web pages (mainly in Internet Explorer) and for automating tasks in Windows environments. It can handle form validation, user interaction, and server side scripting (via ASP). It is largely obsolete today, replaced by JavaScript.

## 10. What is Web Publishing and Cookie?

**Web Publishing** is the process of creating and uploading web content (HTML pages, images, videos) to a web server, so it becomes accessible to users on the internet. It involves designing, developing, and maintaining websites or web applications.

**Cookie** is a small text file that a website stores on a user's computer through the browser. Cookies are used to:

- Remember login sessions
- Store user preferences
- Track browsing behavior for analytics or advertising
- Maintain shopping cart data

Cookies can be **session cookies** (deleted when browser closes) or **persistent cookies** (stored for a set period).
